Programmatic Process Functional Analysis Workbook (FAWB)

Book 21

Rocket Handling System

RHS

Revision 1
January 7, 2004

NOTE: The RHS programmatic process FAWB applies to ANCDF, PBCDF, TOCDF and UMCDF.

ALL FAWB SYSTEMS

Book (Chapter¹)	System Identifier	FAWB Title
<u>UTILITY SYSTEMS (Site-specific)</u>		
1 (5.15)	NGLPG	Fuel Gas System (Natural Gas and Liquefied Petroleum Gas)
2 (5.14)	HYPV	Hydraulic Power Unit and Distribution System
3 (5.19)	BCS	Bulk Chemical Storage System
4 (5.16)	CAS	Compressed Air Systems (Plant, Instrument, and Life Support)
5 (5.22)	SGS	Steam Generation System
6 (5.26)	DMS	Door Monitoring System
7 (5.28)	PCS	Primary Cooling Systems
8 (5.12)	EPS	Electrical Distribution and Emergency Power System
9 (5.13)	—	(HVAC FAWB moved to Book 20 (Process Systems))
10 (5.17)	WATER	Water Systems (Process Water, Potable Water, and Water Treatment Systems)
11 (5.21)	CDSS	Central Decon Supply System
12 (5.18)	TSHS	Toxic Storage and Handling Systems (Agent Collection, Spent Decon, and Sumps)
13 (5.20)	ACSWS	Acid and Caustic Storage and Wash System (DELETED ²)
14 (5.27)	FDSS	Fire Detection and Suppression System
15 -19	—	(not assigned; reserved for future use)
<u>PROCESS SYSTEMS (Programmatic)</u>		
20	HVAC	Heating, Ventilation, and Air Conditioning System
21	RHS	Rocket Handling System
22	PHS	Projectile Handling System
23	MHS	Mine Handling System
24	BCHS	Bulk Container Handling System
25	DFS	Deactivation Furnace System
26	LIC	Liquid Incineration System
27	MPF	Metal Parts Furnace System
28 ³	PAS/PFS	DFS, LIC and MPF Pollution Abatement System and PAS Filter System
29	BRA	Brine Reduction Area and BRA PAS
30	CHB	Container Handling Building
31	ACAMS	Automatic Continuous Air-Monitoring System
32	TCE	Treaty Compliance Equipment
33 ⁴	DUN	Dunnage Incineration System and DUN PAS
34 ³	PFS	LIC, DFS, and MPF PAS Filter Systems (DRAFT only)

¹ TOCDF has original “chapter” numbers for utility system FAWBs.

² The ACSWS FAWB was deleted.

³ The PAS and PFS FAWBs were combined into a single PAS/PFS FAWB (Book 28).

⁴ A DUN FAWB is not being developed per direction of PMCSD on 9-10-98.

	Appendix F	<i>Updated to reflect current source documentation.</i>
	Appendix G	<i>Updated to include DICIs/DICOs for all sites.</i>

SECTION 1

INTRODUCTION

1.1 CSD PROJECT BASELINE TECHNOLOGY OVERVIEW

The Office of the Project Manager for Chemical Stockpile Disposal (PMCS D) is responsible for the disposal of the United States' existing unitary chemical weapon stockpile. PMCS D manages execution of the design, construction, equipment acquisition/installation, systemization, plant operations, and closure of all CSD project sites.

The CSD project baseline technology consists of the following:

- mechanical disassembly or puncturing the munitions to remove chemical agent and any explosives or propellant,
- incineration of the chemical agent and any explosives and propellant, and
- thermal detoxification of metal parts and any contaminated dunnage.

This technology was demonstrated during a series of operational verification testing (OVT) campaigns at the Johnston Atoll Chemical Agent Disposal System (JACADS). JACADS represented the first generation of a full-scale facility implementation of the project baseline technology. JACADS completed disposal of the chemical agent and munitions stockpiled at Johnston Atoll in November, 2000.

The second generation plants implementing the baseline technology include the following:

- Tooele Chemical Agent Disposal Facility (TOCDF), located at the Deseret Chemical Depot in Tooele, Utah;
- Anniston Chemical Agent Disposal Facility (ANCDF), located at the Anniston Army Depot near Anniston, Alabama;
- Umatilla Chemical Agent Disposal Facility (UMCDF), located at the Umatilla Chemical Depot near Hermiston, Oregon; and,
- Pine Bluff Chemical Agent Disposal Facility (PBCDF), located at the Pine Bluff Arsenal near Pine Bluff, Arkansas.

Unless otherwise noted, the programmatic functional analysis workbooks (FAWBs) for process systems apply to each of these CSD sites.

1.2 BACKGROUND

FAWBs for 25 plant systems were issued for JACADS in January 1985 by The Ralph M. Parsons Company (now the Parsons Infrastructure & Technology Group, Inc.). Parsons is the Design and Systems Integration Contractor (DSIC) for the CSD project. The FAWBs provided the basis for the facility control system's programmable logic

controller (PLC) and computer systems programming. The JACADS FAWBs were later revised by United Engineers & Constructors and, by the July 1989 issue, two additional systems had been added.

FAWBs for TOCDF were issued in April 1993 by Parsons. There were 28 plant systems defined for TOCDF; however, only 27 FAWBs were issued (The Residue Handling Area FAWB was not issued). Most of the TOCDF plant systems were the same as those for JACADS; however, there were some differences due to different plant configurations, system consolidations, and the inclusion of additional systems. The TOCDF systems contractor (SC) received the FAWBs and assumed responsibility for maintaining the set current with the TOCDF plant configuration and the evolution of its operational strategy. Utility system FAWBs also were developed for ANCDF, PBCDF and UMCDF. Their purpose is to assist the sites during utility systems equipment procurement, and to describe their use in facility operation. Utility system FAWBs are more site-specific, consist primarily of SC-procured equipment, and will be maintained by the individual demilitarization sites.

In September 1997, PMCSD began the development of programmatic process FAWBs for process systems common to all sites, eliminating the need to maintain separate process FAWBs at each site. Having a single set of process FAWBs provides a means to ensure operational consistency between the sites and to accurately record differences between the demil facilities. The programmatic process FAWBs serve as an invaluable training tool for the Systems Contractor for Training (SCT) to ensure consistent training on process systems for all sites, and to quickly identify site-specific training requirements.

1.3 PROGRAMMATIC PROCESS FAWB SYSTEMS

Sixteen process systems having minimal differences between sites were designated as programmatic systems. These programmatic process FAWBs are maintained as a single reference rather than at each site. Minor site configuration differences between the sites are highlighted in the FAWB discussions and tables. Fourteen of these 16 systems were included in the 28 original plant system FAWBs developed by the DSIC. For conciseness, the dunnage incinerator (DUN) and DUN pollution abatement system (PAS) FAWBs were to be combined into a single FAWB, for a total of 15 programmatic process FAWBs. However, development of a programmatic FAWB for the DUN and DUN PAS was suspended indefinitely at the direction of the PMCSD Operations Team (see FAWB Note B-1). In addition, FAWBs for the wet PAS and the PAS filter system (PFS) were combined into a single FAWB (see FAWB Note B-2). Therefore, a total of 13 programmatic FAWBs were developed for the process systems. The heating, ventilating, and air-conditioning (HVAC) FAWB originally was included as one of the utility system FAWBs produced for ANCDF in 1996 (HVAC FAWB was Book 9 for ANCDF Utility FAWBs). It has been recategorized as a process system and is included in the set of programmatic process FAWBs.

The programmatic process FAWBs are numbered in accordance with the convention established during production of the ANCDF and UMCDF utility system FAWBs. This convention reserves book numbers 1 through 19 for utility systems, and book numbers 20 through 34 for the process FAWBs. Programmatic process FAWB book numbers and

titles are listed in Table 1.1. The original TOCDF FAWB chapter numbers are shown for reference.

Twelve of the 28 original plant system FAWBs are designated as site-specific utility systems. For these systems, the SC is delivered an initial utility FAWB indicating the system design configuration and operational strategy. The SC maintains the utility FAWBs to reflect the site-specific configuration. The utility FAWBs are listed in Table 1.2; original TOCDF FAWB chapter numbers are shown for reference.

The two remaining systems of the 28 originally planned plant system FAWBs are the acid and caustic storage and wash system (ACSWs) (5.20) and the residue handling area (5.24). The ACSWS FAWB at TOCDF no longer is maintained and has not been developed for follow-on sites (see FAWB Note B-3). A FAWB for the residue handling area was not produced due to its lack of automatic control features.

1.4 PROGRAMMATIC PROCESS FAWB PURPOSE

The programmatic process FAWBs serve as a repository for all control information for the automated aspects of the baseline technology demilitarization process systems. They serve as one of the source documents for PLC control system and computer system programming, operator training, and facility operation. These FAWBs also serve as programmatic reference documents that define how the process systems operate and capture the differences between facility operational configurations. Each programmatic process FAWB contains a subsection that defines the system boundaries and identifies the interfaces with other plant process and utility systems.

Programmatic process FAWBs are living documents, subject to configuration control under the CSD project Participant Quality Assurance Plan. They are meant to be continuously updated with user input whenever system modifications are made, or as needed to enhance the information presented. Programmatic process FAWB revisions are implemented as outlined in Section 1.6. The process by which the SCT maintains the programmatic process FAWBs and the roles and responsibilities of each organization affiliated with the CSD project are described in detail in the Programmatic Process FAWB Maintenance Plan.

Programmatic Process FAWB Limitations

Even though the FAWBs contain detailed descriptions of the configuration and control for each process system, they are not all-inclusive. Every effort is made to include the

level of detail necessary to fully describe the specific operating configuration for each process system. Each process FAWB includes supporting references to direct the user to relevant programmatic and site-specific documentation (e.g., standing operating procedures, drawings).

Because of the revision cycle time, there will be a slight lag time between recent changes and their reflection in the FAWB. Maintenance of the FAWBs will be done semiannually, or more frequently if needed, to reflect significant modifications.

The FAWB maintenance program relies heavily on input from each baseline technology demilitarization site. Timely and accurate input ensures that the FAWBs reflect the current configuration at each of the sites. All information received will be thoroughly reviewed to ensure consistent and accurate documentation.

As a programmatic document, the FAWBs describe the configuration and operation of four separate facilities. Care must be taken by the user to ensure that the information extracted from this document reflects the configuration for the facility of interest. Site-specific differences are highlighted in both the text and the appendices to avoid confusion.

1.5 PROGRAMMATIC PROCESS FAWB ORGANIZATION

The process FAWBs document the chemical demilitarization facility operations at ANCDF, PBCDF, TOCDF, and UMCDF. The format and structure of the programmatic process FAWBs differ from the original format prepared by the DSIC, and from the format previously maintained at TOCDF. The information from earlier versions has been retained and updated to reflect lessons learned from the design, construction, systemization, and operation of the demilitarization facilities, including JACADS and the Chemical Agent Munition Disposal System (CAMDS). The overall layout of the programmatic process FAWBs is shown in Table 1-3.

1.6 PROGRAMMATIC PROCESS FAWB REVISIONS

The programmatic process FAWBs are maintained by the SCT to reflect the operational and control system configuration at each CSD site that implements the baseline destruction technology. Each programmatic process FAWB will be reviewed and revised, as required, on a semiannual basis. Individual process FAWBs can be revised more frequently, if needed, to reflect significant configuration changes. Programmatic process FAWB modifications can be generated by the following:

- Engineering change proposals at any of the CSD sites
- CSD project programmatic lessons learned
- Operational modifications that do not involve configuration changes
- Programmatic changes
- Need for greater detail or clarification

The programmatic process FAWB maintenance plan identifies the organizations that participate in the FAWB maintenance program and the responsibilities of each to supply information that could result in revisions to the FAWB. All organizations are represented

on the FAWB Evolvement/Evaluation Team (FEET), and are involved with review of each FAWB revision to ensure that the site configuration and operating strategy is current.

Table 1.3 Organization of the Programmatic Process FAWBs

Section	Title	Contents
1	Introduction	General FAWB background, organization, and revision method
2	System Overview	Purpose of the system; operational and process design basis summary; system boundaries and interfaces
3	Process Description	Description of subsystems; control sequences
4	Component Summary	Tables listing parameters for primary components; power source listings
App. A	Acronyms and Abbreviations	
App. B	FAWB Notes	Notes that provide additional detail or background information
App. C	Alarm and Interlock Matrices	Programmatic matrices or matrices for each site
App. D	PLC Automatic Control Sequences	Automatic logic contained in the PLC code; burner management system automatic controls; sequencer logic for demil systems
App. E	Operator Screens	Advisor PC screens for each site
App. F	Instrument Ranges	Tables showing instrument ranges and setpoints
App. G	Intercontroller Communications	Tables listing the digital intercontroller inputs/outputs (DICIs/DICOs)
App. H	References	Listing of reference documents, including drawings, used to prepare and maintain the FAWB

SECTION 2

SYSTEM OVERVIEW

2.1 PURPOSE AND FUNCTION

The rocket handling system (RHS) begins the demilitarization process for M55 rockets. The RHS transports fully-assembled rockets in their firing tubes from the unpack area (UPA), through the explosive containment vestibule (ECV), and into the explosive containment rooms (ECRs) where the rocket processing equipment is located. In the ECRs, rockets are demilitarized by removing the agent stored in the rocket body cavity and shearing the rocket into pieces. The sheared rocket pieces are fed in batches (i.e., 2 to 5 pieces at a time) to the deactivation furnace system (DFS) for destruction. Drained agent is collected in the agent quantification system in the ECR before being transferred to the agent collection tank in the toxic cubicle (TOX). Agent is fed from the agent collection tank to the liquid incinerator (LIC) system for destruction.

2.2 OPERATIONAL SUMMARY

The RHS is capable of processing the M55 rockets found in the United States' unitary chemical weapons stockpile. There are two identical processing lines for rocket handling and processing. For clarity and conciseness, the following paragraphs describe the operation of a single process line.

2.2.1 Rocket Preprocessing

Palletized rockets are kept offsite in storage igloos. Each pallet consists of 15 rockets. Each rocket is encased in a fiberglass shipping/firing tube in which it remains throughout the demilitarization process. Two rocket pallets are loaded into on-site containers (ONCs) before being trucked to the container handling building (CHB) at the site. ONCs are delivered to the CHB¹ unloading docks and, at ANCDF, TOCDF, and UMCDF, moved to the CHB unpack area (CHB UPA) adjacent to the munitions demilitarization building (MDB) UPA. At PBCDF, ONCs containing ton containers are delivered to the MDB first floor UPA.

Once in the CHB UPA (first floor UPA at PBCDF), ONCs are monitored for leakers before being unloaded. At ANCDF, TOCDF, and UMCDF, if an ONC is found to contain a leaker, the ONC is returned to the first floor CHB lift area and taken by truck to the toxic maintenance area (TMA). At PBCDF, if an ONC is found to contain a leaker, the ONC is transferred to the TMA using the TMA lift skid. ONCs with agent detected and ONCs containing leaker (overpacked) pallets (see section 3.5) are unloaded in the TMA by personnel in demilitarization protective ensemble (DPE).

¹ The CHB FAWB, programmatic process FAWB Book 30, contains more information on CHB operations to support movement of ONCs, and also contains more detail on the differences between the PBCDF CHB configuration and the CHB at the other baseline sites.

Pallets of nonleaking rockets are removed from the ONC in the CHB UPA (first floor UPA at PBCDF). At ANCDF, TOCDF, and UMCDF, pallets are unpacked manually by CHB UPA personnel and individual rockets are loaded manually into the rocket metering input assembly (RHS-FEED-101, -102) which begins the rocket processing. At PBCDF, rocket pallets are loaded onto the UPA lift (UPA-LIFT-101) and raised to the MDB second floor UPA where the pallets are unpacked and loaded into the rocket metering input assembly. At all sites handling and processing of dunnage generated from unpacking rockets is considered a site-specific activity (see FAWB Note B-1).

2.2.2 MDB Rocket Processing

Rockets advance from the rocket metering input assembly in the UPA on rocket/mine input conveyor 1 (MMS-CNVM-101, -102), located inside of an airlock assembly. Rockets are transferred to rocket/mine input conveyor 2 (MMS-CNVM-103, -104) as they enter the ECV, and conveyed through the ECV on this conveyor until they reach the munition access blast gate (MMS-GATE-101, -102). Rockets are conveyed through the blast gate onto the rocket drain station (RDS) input conveyor that conveys the rocket to the RDS of the rocket shear machine (RSM)[RHS-RSM-101, -102]. At the RDS, the rocket is punched with two drain holes and a vent hole². Agent is drained from the two drain holes and transferred to the agent quantification tank before being sent to the agent holding tank in the TOX.

After draining, the rocket is rotated to minimize agent dripping and conveyed to the feed conveyor for the rocket shear station (RSS) of the RSM. At the RSS, the rocket is sheared into eight sections (see FAWB Note B-4). The first section cut, the fuze, is dropped onto the RSM/BSR & MIN discharge blast gate (MMS-GATE-103, -104) and fed to the DFS feed chute with the tail section from the previous rocket. The next four pieces, sections 2 through 5, are fed together, followed by feed of sections 6 and 7. The final section, the tail, is dropped onto the discharge gate and held there until the fuze from the next rocket is cut and dropped onto the gate (see FAWB Note B-5).

2.3 PROCESS DESIGN BASIS SUMMARY

The RHS is designed to perform the initial stages of demilitarization processing for M55 rockets. The RHS drains agent from rockets for collection and subsequent delivery to a LIC, and shears the drained rockets into pieces that are fed to the DFS.

The RHS is configured to have two rocket lines processing simultaneously. If one line is feeding the DFS, processing of the rocket on that line is completed prior to feeding pieces of the rocket on the other line. The processing rate of rockets is limited by the DFS, which is capable of receiving a total feed of about 40 rockets per hour from the RHS.

Rockets are demilitarized in the ECRs, which are designed to withstand the explosive force of 15 lb of trinitrotoluene (TNT) in units of equivalent explosive weight. Normal operations allow only two rockets to be in an ECR at any given time, well below the explosive material limit for the ECRs.

² At TOCDF, many GB-filled rockets were found to contain gelled/crystallized agent, which was difficult or impossible to drain. For these rockets, the RDS was bypassed (see FAWB Note B-15).

2.4 SYSTEM BOUNDARIES AND INTERFACES

The RHS system includes equipment that extends from the UPA rocket metering input assembly, through the ECV, and into the ECRs. The RHS has a direct interface with the DFS³. Rocket draining operations are coordinated with the TOX system. Several plant systems are required to supply the utilities and power for the various operations, machines, and conveyors. The ECR personnel access blast doors and blast gates are interlocked with process operations. The primary interfaces include the following:

- (1) Toxic Storage and Handling: Agent drained by the RDS in the ECRs is pumped to agent collection tanks in the toxic storage and handling system.
- (2) DFS: Sheared rocket pieces are fed to the DFS through the feed chutes in the ECRs.
- (3) Utilities: The RHS requires electric power and hydraulic power for operation of the processing and handling equipment. Plant and instrument air are used to support RHS equipment operation. Process water/decon is used to cool the shear blade on the rocket shear machine during shearing operations. At ANCDF, PBCDF, and UMCDF, process water can be sprayed, when needed, over the RSM/BSR & MIN discharge blast gates (MMS-GATE-103 and -104) to quench smoldering feed and to wash propellant into the DFS chute. At TOCDF, whatever fluid is selected for shear spray is also available for spray onto the RSM/BSR & MIN discharge blast gates.

³ There is no interface listed for the dunnage furnace system. Final disposition of dunnage generated from rocket unpacking operations *is a site-specific activity* (see FAWB Note B-1).

SECTION 3

PROCESS DESCRIPTION

3.1 INTRODUCTION

The rocket handling system (RHS) is comprised of subsystems and components used to handle and process rockets at the demilitarization facilities. Rocket processing is accomplished in the explosive containment rooms (ECRs) where the rockets are punched and drained to remove agent and subsequently sheared into eight pieces that are fed to the deactivation furnace system (DFS) for processing. There are two similar, parallel process lines to process rockets (i.e., lines A & B). Similar equipment, components, instrumentation, and controls are provided for each process line. For clarity and conciseness, the following subsections describe the operation of equipment associated with a single, process line. When tag numbers are specified, line A numbers are used; however, the same component or instrument exists for line B with a different tag number/name.

Rockets are manually loaded into the RHS rocket metering input assembly in the unpack area (UPA) and automatically transported by conveyors through the explosive containment vestibule (ECV) to the ECRs. The RHS processing and handling equipment is described in detail in the following subsections.

3.2 ROCKET PROCESSING EQUIPMENT

Rockets are processed in the ECR by the rocket shear machine (RSM)[RHS-RSM-101]. A maximum of two rockets can be processed by the RSM at any one time. One rocket is drained at the rocket drain station (RDS)¹; while, the other is sheared at the rocket shear station (RSS). The drained agent is measured and sent to the toxic cubicle (TOX). Sheared rocket pieces are sent to the DFS.

Safety concerns prohibit the shearing and/or punching of rockets while any munitions access the blast gate or DFS feed gate is open, or while the personnel access blast door is open (i.e., defined as not closed). When either the shear blade or punches are not retracted, the doors and gates are interlocked closed. The door and gate position switches are wired into the RHS controller, and are displayed on the process control screen. The various gates in the ECR can be controlled from the RHS control screens.

The munitions access blast gates (PHS-GATE-101 and PHS-GATE-103) used for projectile/mortar processing² are not required in the rocket campaigns. These gates remain closed throughout the rocket campaign. Opening a projectile-line, munitions

¹ *At TOCDF, many GB rockets were found to have gelled/crystallized agent, which was difficult or impossible to drain. For these rockets, the RDS was bypassed and the RSM processed only one rocket at a time (see FAWB Note B-15).*

² *PBCDF does not have these gates.*

access blast gate stops the RSM. The gates must be closed and the closed position switches active, or the gates must be locked closed and the position switch active, before starting the rocket campaign.

3.2.1 Rocket Shear Machine

The RSM is comprised of two major workstations: the RDS and the RSS. The RDS consists of the input conveyor, rotator, top and bottom clamps, vent punch, front and rear drain punches, lift table, and positive stop. The RSS is divided into two functional groups: the rocket transport assembly consisting of the feed conveyor, collar stops, and pusher assembly; and, the shear assembly consisting of the shear station and the decon/water spray valve.

RDS and RSS operations are controlled by sequencers. The RDS and RSS sequencer tables, depicting all major and minor steps, are included in Appendix D.

3.2.1.1 Rocket Drain Station

Rockets are transported into the ECR by the RDS input conveyor as they are conveyed out of the ECV by rocket/mine input conveyor 2 (MMS-CNVM-103). The input conveyor is hydraulically driven and controlled through a hydraulic valve manifold.

With the munition access blast gate (MMS-GATE-101) open and the positive stop cylinder at the drain station raised, the RDS input conveyor motor is started. The positive stop blocks the front end of the shipping/firing tube, thus stopping the rocket. After the rocket is in position at the stop, the blast gate is closed, the rocket is clamped, the vent and punch cylinders are extended, and the rocket is punched and drained.

The top clamp cylinders are hydraulically linked and operate simultaneously. The top clamp cylinders are extended immediately after the bottom clamp cylinder. The bottom clamp remains extended (i.e., clamped) throughout the drain cycle. The bottom clamp maintains a seal around the drain holes to ensure maximum suction from the agent *transfer* pump (*ACS-PUMP-109*).

The RDS input conveyor is stopped after the rocket is clamped. The rear drain punch cycles (i.e., extends and retracts) and the vent punch extends before the front drain punch cycles. After cycling the front drain punch, the vent punch is retracted. The drain timer starts when all punches have been cycled.

Agent is drained into the agent quantification system (AQS) tank for the duration of the drain timer (see Subsection 3.2.1.4).

After the rocket has been drained and the amount collected has been verified, the clamps are retracted and the rocket is rotated 90° in the counterclockwise direction when looking at the tail-end of the rocket. Rotating the rocket minimizes any residual agent from dripping out of the rocket while it is being transferred and sheared.

The sequence of operation for rotating the rocket is as follows: clamp cylinders retracted, positive stop cylinder retracted (stop raised), lift table cylinders extended (lift table raised), rotator rotated to turn rocket 90°; lift table cylinders retracted (lift table lowered), rotator rotated back to the start position (rotator reset), RDS input conveyor started forward (rocket indexed).

The RDS input conveyor starts forward if the RSS is ready to receive a rocket. The RDS input conveyor remains running until the rocket clears the RDS and is detected at the RSS. With the drain station empty, the RDS generates a demand for rockets and resets the RDS cycle.

3.2.1.2 Rocket Shear Station

The RSS receives drained rockets from the RDS and cuts the rocket into eight sections (see FAWB Note B-4). The first cut is made approximately 4.5 in. from the tip of the rocket. This cut separates the fuze, or the explosive-initiating components, from the rest of the body, which contains explosive and propellant components. This separation avoids creating an explosive combination within the DFS rotary kiln.

The rocket is moved into position by the feed conveyor, which is a hydraulically-driven roller conveyor. As a rocket moves past the fiber-optic sensors next to the shear blade assembly, the collar stops are extended. The conveyor stops when the rocket is seated at the RSS collar stops. Then, the pusher is activated and moved to hold the rocket against the collar stops while the fuze is cut. After the fuze is cut and the shear blade retracted, the collar stops retract to allow the pusher to index the rocket forward for the remaining cuts.

A count of the number of rockets processed is based on the sequencer. When the sequencer reaches the last step after the last rocket piece has entered the DFS chute, the total rocket demilitarized count is incremented. This total is displayed in the control room (CON). The incremental shear blade counter is reset every time a rocket is brought into the first-cut position.

The rockets are fed to the DFS from one ECR after the DFS controller cycles the feed gates. The RSM controller monitors the top feed gate closed position switch. The tail of the previous rocket and the fuze of the current rocket are followed by a 30-second time delay. During this time, the RSM cuts sections 2 through 5, feeds sections 2 through 5, and cuts sections 6 and 7. Then, there is a 10-second time delay. The RSM feeds sections 6 and 7, pushes the tail, and initiates the restart sequence (see FAWB Note B-5). Therefore, one rocket is processed completely before alternating to the other ECR to feed the next rocket. The approximate cut lengths used for GB rocket shear processing at TOCDF are shown in Table 3.1.

The communications required between the RSM and other plant systems are listed in Appendix G.

The shear blade is cooled by a spray system that can use either water or decon. Decon can be sprayed through the system by realigning a remotely controlled, three-way valve (42-HV-286). When processing GB rockets, decon is used; water is used for VX rocket processing (see FAWB Note B-6). The valve opens just before the shear blade extends and closes immediately after the shear blade retracts. The cooling water is required to prevent ignition of the rocket energetic material. The spray also rinses energetic and agent residue from the blade, minimizes agent-vapor generation, lubricates the blade, and helps to control dust in the ECR.

To cut a rocket, the rocket controller determines the rocket position based on input from an encoder on the pusher. The encoder counts off the relative position of the rocket

based on the home position. When the rocket is first staged, approximately 4.5 in. of the rocket nose overhangs the shear blade. At this time, the fuze is sheared and the RSS is set to begin indexing and shearing.

Table 3.1 TOCDF Rocket Shear Machine Cut Lengths¹

Cut Length No.	Approximate Length (in)
1	4.7
2	8.8
3	9.0
4	10.0
5	11.9
6	11.9
7	9.6
8	16.2

3.2.1.3 DFS Feed Chute and Gate Assembly

The DFS feed chute and gate assembly is controlled by the DFS controller (see the DFS FAWB, Programmatic Process FAWB Book 25).

3.2.1.4 Agent Quantification System

The AQS provides a vacuum source that is used to draw agent out of the rocket, and a collection tank where it is held prior to transfer to the agent holding tank in the TOX. Each AQS consists of an agent filter (ACS-FILT-103), AQS verification tank (ACS-TANK-103), agent transfer pump (ACS-PUMP-109), and associated valves, piping and instrumentation. Differences between *site* configurations are noted in the following descriptions.

Agent is drained from the rocket to the agent filter, transferred to the AQS verification tank for quantification, and then transferred to the agent holding tank in the TOX. *The agent transfer pump begins running when a rocket is brought into the ECR to ensure that a good vacuum is drawn in the AQS prior to draining operations. It runs throughout the drain sequence until the rocket is rotated in preparation for transfer to the shear station.* The AQS tank vacuum valve remains open for most of the sequence to maintain a vacuum in the AQS tank. It closes during quantification of agent, remains closed while the tank is drained, and reopens when the RDS is ready to receive the next rocket.

Prior to punching the rocket, the PLC ensures that there is sufficient vacuum in the AQS to proceed with the drain sequence. If the AQS system pressure is above a specified value, the RDS sequencer stalls until the vacuum is adequate for draining. This check is

performed with the AQS tank vacuum valve open and the strainer vacuum⁴/drain valves closed.

With sufficient AQS vacuum, the rear punch extends and retracts followed by extending the vent punch, cycling the front punch, and finally retracting the vent punch. Agent draining operations begin when all punches are retracted. The drain time timer starts and the strainer drain valve opens.

The AQS vacuum draws agent from the rocket into the agent filter. TOCDF uses a simplex strainer *for filtering*; follow-on sites use duplex strainers (see FAWB Note B-7). The duplex strainers are equipped with separate strainer vacuum/drain valves associated with each strainer basket. A CRO uses a hand-switch to position a three-way valve to direct agent to one of the strainer baskets. This selection determines the strainer drain valve that *is* operated during the drain sequence.

With the strainer drain valve open, agent is drawn through the filter and into the AQS verification tank. After the drain time timer finishes, the AQS tank vacuum valve closes. After a short time delay to allow the liquid to settle, the AQS tank level indicating transmitter (51-LIT-51) is brought online by opening the two AQS tank level sensor isolation valves (51-XV-55A & 55B @ AN/TE; 51-XV-70A & 70B @ PB/UM) [see FAWB Note B-8]. A differential-pressure level detector senses the AQS tank level. The strainer drain valve remains open during verification of agent tank level to ensure that the pressure in the AQS tank headspace is in equilibrium with the ECR room pressure.

If the agent level measured in the AQS tank ever exceeds twenty inches a TANK LEVEL HI alarm (*alert at AN/TE; see Appendix C*) is sent to the CON.

The PLC compares the measured agent level in the AQS tank against the nominal fill level for the M55 rocket. If the agent level measured in the AQS tank is 95% or more of the nominal level, the rocket is considered sufficiently drained. The AQS tank drain valve is opened and the bottom drain, upper and vent clamps are retracted. Agent is drawn out of the AQS tank and sent to the TOX. If the agent level in the AQS tank is not zero by the time the AQS tank drain valve has been open for 15 seconds, a TANK NOT DRAINING alarm (*alert at AN; see Appendix C*) is sent to the CON. The timer for this alarm/*alert* starts when the AQS tank drain valve indicates OPEN. When the AQS tank level LIT indicates an agent level less than the minimum required for three seconds, the AQS tank LIT isolation valves close, the AQS tank drain valve closes, and the AQS tank LIT purge valve (51-XV-70 @ AN; 51-XV-107 @ PB/UM; 51-XV-55C @ TE) opens for 15 seconds to purge any agent from the sensing line (see FAWB Note B-9). Purge air is supplied from the instrument air system. Finally, the strainer drain valve and AQS tank drain valve close and the drain cycle is complete.

⁴ *Strainer vacuum valves are no longer used in the RDS sequence and are always closed. ANCDF has removed the valves and piping from the AQS system (see FAWB Note B-16).*

If the agent level measured in the AQS tank is less than 95% of the nominal level, the CON operator can use the REPEAT function to repeat the drain sequence. The decision to repeat the drain sequence is based on two items: (1) the amount of agent drained from the rocket as indicated by the LIT, and (2) the amount of agent currently being processed in the DFS, which is calculated from the agent heel left in the previously processed rockets.

A rocket that does not drain sufficiently cannot be fed to the DFS if its agent heel causes the DFS to exceed the allowable hourly feed rate. When the agent heel in the rocket no longer exceeds the allowable feed rate, the rocket can be sheared and fed to the DFS. DFS allowable hourly feed rates are discussed in the DFS FAWB (Programmatic Process FAWB Book 25).

The AQS tank level sensor's purge valve is interlocked from opening if either of the isolation valves connecting the sensor to the line is OPEN. This is necessary to prevent the higher-pressure purge air from being fed to a delicate instrument.

Agent drained from the rocket agent cavity is measured by the AQS and recorded by the PLC. This amount is added to the total quantity of agent drained for the day (i.e., 24-hour period running from midnight to midnight). The PLC subtracts the amount drained from the nominal fill value for an M55 rocket to determine the amount of agent heel remaining in the rocket. This agent heel is fed to the DFS along with the sheared rocket. This amount of heel is added to a rolling total of agent fed to the DFS each hour to ensure that the maximum hourly feed rate is not exceeded.

3.3 ROCKET HANDLING EQUIPMENT

3.3.1 UPA Rocket Handling

3.3.1.1 Rocket Metering Input Assembly

The UPA operators manually load rockets into the rocket metering input assembly (RHS-FEED-101). The rocket metering input assembly consists of a feed table, rotating drum, and reject table. The rocket metering input assembly is integral with the rocket/mine-input conveyor 1 and airlock assembly (MMS-CNVM-101). The input conveyors and the airlock separate the UPA from the ECV. The rocket exits the rocket metering input assembly drum via a flapper gate.

When a rocket is loaded, it moves by gravity to the load position next to the drum. A diffused-type infrared (IR) photoelectric sensor detects the presence of a rocket in the feed position. This causes the PLC to check the orientation switch beneath the slot in the feed table.

The orientation switch is a lever-actuated, limit-type switch that senses the collar on the rocket shipping tube. If the collar is detected, the rocket is flagged as oriented; otherwise, the rocket is flagged as misoriented. In either case, the drum then is rotated clockwise, or forward, to the home position. A slot in the drum rotates past the feed position, allowing the rocket to roll into the slot. The rocket then is carried to the home position. With the drum at the home position and the drum slot full, as detected by another IR sensor (i.e., ROCKET DETECTED), the PLC rotates the drum either forward (i.e., clockwise) or reverse (i.e., counterclockwise), depending on the orientation switch status.

The PLC checks to see if the misoriented flag in the PLC is set. If the flag is set, the drum is rotated in reverse until the home position switch is tripped. The rocket falls out of the drum slot onto the reject table located below the feed table. After six rockets have been discharged to the reject table, an alarm (*alert at AN; see Appendix C*) is generated and indicated in the CON; the PLC stops the rocket metering input assembly when the next reject rocket is detected. The reject table then must be cleared before processing can resume.

The drum continues to rotate in reverse until the PLC stops the drum at the home position. In this position, the two slots in the drum are pointed straight up and down and both slots are empty. The feed cycle is repeated whenever a rocket is detected in the feed position and the top slot is empty.

If the rocket is correctly oriented and no rockets are detected on either rocket/mine input conveyor 1 or 2, the drum is rotated forward. If a rocket is at the feed position on the feed table, it is loaded into the drum. The drum continues to rotate in forward until the PLC stops the drum at the home position, where the feed cycle is reset. The rocket that was originally in the slot is dropped onto rocket/mine input conveyor 1. The flapper gate through which the rocket exits is hinged to remain closed against the differential air pressure between the UPA and the ECV. The rocket is moved to rocket/mine input conveyor 2 in the ECV where it is stopped by a pneumatically operated stop.

Operation of the drum is controlled by a reversible, electric-brake motor and an electrically driven clutch assembly. Normally, the drum motor is started in forward and continues to run until a misoriented rocket is found. At that time, the motor is stopped by the PLC and restarted in reverse. The control system has individual control of both the motor and the clutch operations. In addition to CON operations, local control stations also are provided that control the following drum movements: motor-start forward, motor-start reverse, motor stop, and clutch engage/disengage. Local control is enabled by placing the local-off-remote (LOR) switch in the LOCAL position. CON control is enabled only when the CON senses the LOR switch in the REMOTE position.

When the CON and PLC remotely operate the rocket metering input assembly, the PLC sequences the movement of the drum with the conveyors and the RSM.

3.3.1.2 Rocket/Mine Input Conveyor 1 and Airlock Assembly

Rocket/mine input conveyor 1 and airlock assembly (MMS-CNVM-101) is an integral part of the rocket metering input assembly. The conveyor receives rockets as they roll out of the metering drum and sends them forward to rocket/mine input conveyor 2 (MMS-CNVM-103) in the ECV. A retro-reflective IR sensor detects the presence of a rocket on the conveyor. The presence of a rocket is indicated in the CON. The failure to clear the sensor by the rocket breaking the beam within a time period generates a FAIL TO ARRIVE alarm (*alert at AN; see Appendix C*) in the CON.

Rocket/mine input conveyor 1 is an electric, motor-driven, roller conveyor designed to allow the motor to run continuously during processing. The PLC monitors the conveyor's motor-starter, auxiliary contact and generates a malfunction alarm (*alert at AN/TE; see Appendix C*) when conveyor status does not agree with the desired control. Hydraulically powered conveyors do not have a malfunction alarm. The conveyor can be

operated by local control stations or remotely by the CON. An LOR switch selects the mode of operation.

The LOR switch must be in the REMOTE position for the CON to have control over the conveyor motor. The motor is locked out from the CON by placing the LOR switch in either LOCAL or OFF positions. With the LOR switch in the REMOTE position, the CON can start the conveyor motor in either forward or reverse, and also can stop the conveyor motor. With the LOR switch in the LOCAL position, the local operator can perform these same functions. The control room operator (CRO) can stop operating equipment regardless of the operating mode (i.e., LOCAL or REMOTE).

3.3.2 ECV Rocket Handling

Normally, rockets are received in the ECV from the rocket metering input assemblies. When processing leakers, DPE workers manually load them onto rocket/mine input conveyor 2.

Rocket/mine input conveyor 2 is similar in operation to rocket/mine input conveyor 1, except there is an added stop. The stop consists of a steel plate that is raised and lowered by a pneumatic cylinder between the rollers, near the discharge end of the conveyor. Rockets are stopped by the raised stop. When the stop is raised and a rocket is detected as present at the stop, the conveyor rollers stop running. To continue processing, the stop is lowered. In AUTO, after the stop is lowered, the conveyor rollers start running to move the rocket towards the ECR. The stop can be controlled either locally or remotely.

The line A conveyor *was originally equipped* with a swing roller at the discharge end to bridge the gap between the end of the conveyor and the start of the next conveyor in the ECR. It *was* provided for use during the mine campaign. *Because of modifications to the mine machine input conveyor, the swing roller on rocket/mine input conveyor 2 is no longer needed and has been removed at ANCDF and UMCDF. PBCDF also plans to remove it*⁷. The swing roller *was* hardwired to operate in concert with the ECR munitions access blast gate.

3.4 RHS INITIALIZATION, STARTUP, AND PARK

The first step in operating the RSM is to ensure that all the conditions are satisfied to allow the system to run. This includes the Limiting Conditions of Operation (LCO) checklist and the pre-operational checklist. One of the conditions required is to select the proper campaign from the CAMPAIGN SELECT screen (CSS). The operator must select the M55 entry under the appropriate ECR, depending on which ECR is employed. The second campaign selection task is to choose the agent type to be processed. Once the selections are made, the operator must verify the selection by activating the VERIFY CAMPAIGN SELECTION icon and depressing the START key. When proper selection is made, the icon turns green, indicating the system is configured for processing rockets.

The operator begins system initialization after the correct campaign is selected and verified. If both ECRs are to be in operation, then both lines need to be initialized

⁷ The mine handling system (MHS) FAWB [Programmatic Process FAWB Book 23] contains more information about operation of the swing roller.

separately. System initialization restores the machine from the PARK condition and prepares the line for processing. In order to initialize, the operator resets all emergency stops and rope switches, and sets all associated equipment to automatic and configures the hydraulics for the machine. The rocket machine's sequencer also must be in automatic to allow the initialize step to occur.

Initialization prepares the line for processing by running all the conveyors forward and placing devices in the operating position. The conveyors are started in order to locate any rockets remaining on the line from previous processing runs.

To start the initialization procedure, the operator accesses the ROCKET INITIALIZE screen (RLI), selects the SYSTEM INITIALIZE icon, and depresses the START key. Before the equipment will start initializing, the warning horns sound for ten seconds and the warning lights illuminate to notify plant personnel that the line is about to start. If the equipment was running within the last ten minutes, the warning lights still will be illuminated, but the warning horns are not required to sound. If the horns are required to sound, they are silenced after the 10-second delay and the equipment commences the initialization sequence. After the system is successfully initialized, the icon changes from flashing green to steady green. This notifies the operator that the system is available to be placed in the run mode and begin processing. In the event the initialization attempt fails, an alarm ([alert at AN/TE; see Appendix C](#)) is generated and the icon flashes red. When the FAIL TO INITIALIZE alarm/[alert](#) is acknowledged, the failed station attempts re-initialization.

After successful system initialization, the RHS can be placed into operation. Prior to operation, there are several interlock conditions that have to be satisfied. The system must verify that all necessary utilities are up and running, the DFS and the TOX are ready for processing, and the ECR access blast doors (ECR-BLDR-101, -102), the munition access blast gates (MMS-GATE-101, PHS-GATE-101, -103), and the RSM/burster size reduction machine and mine machine (RSM/BSR&MIN) discharge blast gate (MMS-GATE-103) are secured. Also, all rope switches and local emergency stops must be reset. When all the conditions are satisfied, the operator can issue the SYSTEM START command by accessing the RLI screen, selecting the SYSTEM START/STOP icon, and depressing the START key. If all the conditions for system start are met, the icon on the RLI screen is displayed in green and all continuously running devices are started.

At TOCDF, fiber optic sensors PLS-3, PLS-5A, PLS-5B and PLS-6 utilize an air blower system to keep the line-of-sight free from dust, dirt, debris, and vapor, etc. that could give a false indication of rocket presence. This system operates only in manual mode, is started prior to initiating feed, and is stopped following completion of rocket processing.

The RHS includes a processing rate control feature that allows rockets to process at a rate below the maximum (i.e., 38 rockets per hour). The desired rate is set by the operator on the RLI screen and maintained by the PLC. To lengthen the processing time and decrease the processing rate, the duration of the drain timer is increased to a value calculated by the PLC to give the selected rate. The processing rate is set following system start, prior to initiating feed, and can be changed at any time during operation.

Operators PARK the system when the processing run is complete. The PARK function drives all the hydraulic devices to a safe-shutdown position, or to the gravity-driven state, and de-energizes all outputs.

The system must be stopped prior to issuing the PARK command. Before stopping the system, however, the operator visually checks the line for any remaining rockets. This aids in the startup of the next processing run. To stop the automatic operation, the operator accesses the RLI screen, selects the SYSTEM START/STOP icon, and depresses the STOP key. The SYSTEM START/STOP icon turns to magenta, indicating that the system is stopped. To initiate the PARK function, the operator accesses the RLI screen, selects the PARK MACHINE icon, and depresses the START key. Once the machine stations are parked, the icon goes from flashing green to steady green. In the event the park attempt fails, an *alert (currently still an alarm at UM; see Appendix C)* is generated and the icon flashes red. The cause of the failure must be corrected before the alarm/alert is acknowledged. Once the cause of the failure is corrected, the operator accesses the RLI screen and depresses the ACKNOWLEDGE key. The PARK MACHINE icon returns to magenta. At this time, the operator reselects the PARK MACHINE icon, depresses the START key again, and the failed station attempts to re-park.

3.5 ROCKET LEAKER HANDLING

When agent is detected within a stockpile structure (i.e., igloo), the leaking munition is identified, removed from its pallet configuration, decontaminated, and placed in an overpack. Leaking rockets discovered in a storage igloo are overpacked in steel containers. Overpacked munitions are transferred to a separate storage igloo where the overpack containers are palletized for continued storage.

Pallets of overpacked rockets are delivered in ONCs to the UPA, similar to nonleaking munitions. Because of the overpack, however, the leakers cannot be loaded onto the rocket metering input assembly. The entire pallet is loaded onto the bypass line turntable, conveyed through the airlock into the ECV, and unpacked by workers in demilitarization protective ensemble (DPE). Each rocket is removed from its overpack and manually loaded onto rocket/mine input conveyor 2 in the ECV. Once the rockets are loaded onto the conveyor, they are conveyed into the ECR and processed in the same manner as nonleaking munitions⁸. Empty overpacks are placed in a cradle and sent to the MPF for decontamination.

Leaking rockets can also be detected after delivery of a loaded ONC to the CHB UPA (first floor UPA at PBCDF) where the ONCs are monitored before being unloaded. At ANCDF, TOCDF, and UMCDF, if an ONC is found to contain a leaking rocket, the ONC is returned to the first floor CHB lift area and taken by truck to the toxic maintenance area (TMA) [see FAWB Note B-10]. At PBCDF, if an ONC is found to contain a leaker, the ONC is transferred to the TMA using the TMA lift skid. In the TMA,

⁸ *At TOCDF, some overpacked rockets were found to be fitted with end caps to seal the shipping and firing tube. The end caps were epoxied to the tube and could not be removed. For these rockets, the normal processing sequence was modified to account for the end caps (see FAWB Note B-17).*

personnel in DPE unload the rocket pallets from the ONC and place the pallets in a rocket leaker carrier on a tray assembly (see FAWB Note B-11).

At ANCDF, TOCDF, and UMCDF, the pallets are conveyed out of the TMA onto the lower munitions corridor charge car and run backwards along the bulk conveyor lines into the ECV (see the bulk container handling system (BCHS) FAWB [Programmatic Process FAWB Book 24] for descriptions of the bulk conveyor lines). The path back to the ECV includes transferring the pallets in reverse through the munitions buffer storage conveyors in the buffer storage area (BSA), up on a lift-car assembly to the munitions processing bay (MPB), in reverse on the conveyors in the MPB to the charge car in the upper munitions corridor, and then in reverse on a bypass-indexing, hydraulic conveyor to a bypass conveyor in the ECV.

At PBCDF, pallets with leaking rockets are placed in a rocket leaker carrier on a tray assembly (see FAWB Note B-11) on the TMA conveyor (TMA-CNVP-102) and conveyed out of the TMA to the bulk drain station (BDS) room onto the overpack conveyor (MMS-CNVP-134). The pallets are moved from the overpack conveyor to ton container conveyor 3 (MMS-CNVP-136) using the BDS monorail (BDS-MONO-401) and then into the lift car (MMS-LIFT-101) in the BDS room. The pallets are raised by the lift car up to the munitions corridor (COR) on the second floor and conveyed back from the COR to the ECV.

In the ECV, workers in DPE unpack the pallets and place the rockets on rocket/mine input conveyor 2. The rockets are conveyed into the ECR and processed in the same manner as nonleaking rockets, *unless they are equipped with end caps (see footnote on previous page).*

3.6 ROCKET DUNNAGE HANDLING

Both uncontaminated and contaminated dunnage is generated during the rocket pallet unpacking process. The dunnage consists of wooden pallet straps, clips, and any other packing material separating or surrounding the rocket firing/shipping tubes. If a pallet does not contain any leaking munitions, the dunnage is treated as uncontaminated dunnage. If a pallet contains a leaking rocket, the dunnage is treated as contaminated dunnage.

Uncontaminated pallets are unloaded by operators in the UPA. Dunnage removed from around leakers is assumed to be contaminated with agent and is handled in the ECV or TMA. Handling and disposal of both contaminated and uncontaminated dunnage is considered a site-specific activity (see FAWB Note B-1).

SECTION 4

COMPONENT SUMMARY

4.1 ROCKET HANDLING SYSTEM COMPONENTS

The components of RHS include the rocket metering input assembly, the rocket shear machine, conveyors, doors, gates, and associated instrumentation. Power source information for the components is listed in Table 4.1.

4.2 EQUIPMENT POWER SOURCES

Table 4.1 lists the equipment power sources for the major equipment used in the RHS based on *site drawing revisions listed in Appendix H*. Power sources are characterized as critical, essential or utility. Critical loads are powered by the UPS panelboards and do not experience an interruption in power if offsite power is lost. Essential loads are required for safe shutdown of the facility, but can tolerate an interruption in power while being loaded on an onsite emergency diesel generator (EDG). Utility loads are not required if offsite power is lost and are not powered by the onsite EDG. Only motive power sources are listed in the table; instrumentation and control power sources are not listed. In addition, hydraulically and pneumatically powered, and non-powered equipment are not included in the table.

Table 4.1 RHS Equipment Power Sources

Equipment Tag	Description	Site(s)	Power Source	Power Type
MMS-CNVM-101	Rocket/Mine Input Conveyor No.1 and Airlock Assembly (A)	AN/TE/UM	SPS-MCC-103	Utility
		PB	SPS-MCC-104	Utility
MMS-CNVM-102	Rocket/Mine Input Conveyor No.1 and Airlock Assembly (B)	AN/PB/TE/UM	SPS-MCC-104	Utility
MMS-CNVM-103	Rocket/Mine Input Conveyor No.2 (A)	AN/TE/UM	SPS-MCC-103	Utility
		PB	SPS-MCC-104	Utility
MMS-CNVM-104	Rocket/Mine Input Conveyor No.2 (B)	AN/PB/TE/UM	SPS-MCC-104	Utility
RHS-FEED-101	Rocket Metering Input Assembly (A)	AN/TE/UM	SPS-MCC-103	Utility
		PB	SPS-MCC-104	Utility
RHS-FEED-102	Rocket Metering Input Assembly (B)	AN/PB/TE/UM	SPS-MCC-104	Utility

APPENDIX A

Acronyms and Abbreviations

The acronyms and abbreviations listed below are common for all of the programmatic process FAWBs:

A&I	alarm and interlock matrix
AASS	automatic agent sampling system
ABCDF	Aberdeen Chemical Agent Disposal Facility
AC	alternating current
ACAMS	automatic continuous air monitoring system
acfm	actual cubic foot per minute
ACS	agent collection system
ACSWS	acid and caustic storage and wash system
ADC	air dilution controller
AgF	silver fluoride
AHT	agent holding tank
AHU	air handling unit
AMC	Army Materiel Command
ANAD	Anniston Army Depot (Alabama)
ANCDF	Anniston Chemical Agent Disposal Facility
ANSI	American National Standards Institute
AQS	agent quantification system
AR	Army Regulation
ASA	automatic submerged arc
ASC	allowable stack concentration
ASD	adjustable-speed drive
ASME	American Society of Mechanical Engineers
ASTM	American Society for Testing and Materials
AWS	acid wash system
AWFCO	automatic waste feed cutoff
BCHS	bulk container handling system
BCS	bulk chemical storage
BDS	bulk drain station
BGCDF	Blue Grass Chemical Agent Disposal Facility
BLAD	blast load attenuation duct
BMS	burner management system
BPS	burster punch station (MIN)
BRA	brine reduction area
BRS	burster removal station (PMD)
BSA	buffer storage area
BSR	burster size reduction machine
Btu	British thermal unit
°C	degrees Celsius
CAMDS	Chemical Agent Munition Disposal System
CAB	combustion air blower

CAL	chemical assessment laboratory
CAS	compressed air system
CBR	chemical, biological, and radiological (filter)
CCB	configuration control board
CCS	central control system
CCTV	closed-circuit television
CDS	central decontamination supply
CDSS	central decontamination supply system
CDTF	Chemical Demilitarization Training Facility
CEHNC	U.S. Army Engineering & Support Center, Huntsville.
CEMS	continuous emission monitoring system
CFR	Code of Federal Regulations
CGA	Compressed Gas Association
CHB	container handling building
CHWS	chilled water supply
CO	carbon monoxide (monitors/analyzers)
COM	communications system
CON	control room
COR	munitions corridor
CPA	client-Parsons authorization
CRO	control room operator
CRT	cathode ray tube
CS	crimp station (PMD)
CSS	campaign select screen
CSD	Chemical Stockpile Disposal (Project)
CV	control variable
CWC	Chemical Weapons Convention
CWS	chilled water supply
DAAMS	depot area air monitoring system
DAFC	dilution airflow controller
db	dry bulb
DC	direct current
DCD	Deseret Chemical Depot
DDESB	Department of Defense Explosives Safety Board
decon	decontamination (solution)
demil	demilitarization
DFS	deactivation furnace system
DICI	digital intercontroller communication input
DICO	digital intercontroller communication output
DMS	door monitoring system
DPE	demilitarization protective ensemble (suit)
DSA	DPE support area
dscf	dry standard cubic foot
DSIC	design and systems integration contractor
DUN	dunnage incinerator
E&M	engineering and maintenance
E-stop	emergency stop
EAC	equipment acquisition contractor
ECF	entry control facility
ECP	engineering change proposal
ECL	engineering control level

ECR	explosive containment room
ECV	explosive containment vestibule
EDG	emergency diesel generator
EHM	equipment hydraulic module
EIC	equipment installation contractor
EONC	enhanced onsite container
EPS	emergency power system
ETL	extreme temperature limit
°F	degrees Fahrenheit
FARS	fuzewell assembly (or adapter) removal station
FAWB	functional analysis workbook
FDLL	field design lessons learned (program)
FDPS	fire detection and prevention system
FEET	FAWB evolvement/evaluation team
FEM	fire extinguishing medium
FIFO	first-in-first-out
FIL	activated carbon and HEPA filter
FPD	flame photometric detector
fpm	feet per minute
FSSS	flame safety shutdown system
ft	feet
GA	general arrangement; nerve agent ethyl N-dimethylphosphoramidocyanide (C ₅ H ₁₁ N ₂ O ₂ P)
gal	gallon
GB	nerve agent Sarin, isopropyl methyl phosphonofluoridate (C ₄ H ₁₀ FO ₂ P)
GC	gas chromatograph
GDL	gross detection level
GEN	emergency generator
GFE	government-furnished equipment
GLD	gross level detector
GPD	gas plasma display
GPL	general population limit
gpm	gallons per minute
gr	grain
H	blister agent mustard, made by the Levinstein process, bis(2-chloroethyl) sulfide or 2,2'-dichlorodiethyl sulfide (C ₄ H ₈ Cl ₂ S _{1.5} [empirical formula])
H ₃ PO ₄	orthophosphoric acid
HCl	hydrochloric acid
HD	blister agent distilled mustard, bis(2-chloroethyl) sulfide or 2,2'-dichlorodiethyl sulfide (C ₄ H ₈ Cl ₂ S)
HDC	heated discharge conveyor
HDV	hydraulic directional control valve
HEPA	high-efficiency particulate air (filter)
HLE	high-level exposure
HOA	hand-off-auto
hp	horsepower
hr	hour
HRA	health risk assessment
HT	60% by weight blister agent distilled mustard and 40% agent T [bis[2(2- chloroethylthio)ethyl] ether]
HVAC	heating, ventilating, and air-conditioning

HVC	heating, ventilating, and cooling
HYD	hydraulic power
HYPV	hydraulic power unit
HYVM	hydraulic control valve manifold
I/O	input/output
I-lock	interlock
IAS	instrument air system
icfm	inlet cubic foot per minute (acfm at the inlet)
ICS	instrumentation and control system
ID	induced draft
	inside diameter
IDLH	immediately dangerous to life and health
IGS	inertial gas sampling
in.	inch
in. wc.	inches water column
IR	infrared
ISO	International Standards Organization
JACADS	Johnston Atoll Chemical Agent Disposal System
kW	kilowatt
L	Lewisite (blister agent)
LAB	laboratory
lb	pound
lb/hr	pounds per hour
LCO	limiting condition of operation
ln	line
LIC	liquid incinerator
LIFO	last-in-first-out
LIT	level-indicating transmitter
LOQ	limit of quantification
LOR	local-off-remote
LPG	liquefied petroleum gas
LQAP	Laboratory Quality Assurance Plan
LQCP	Laboratory Quality Control Plan
LR	local-remote
LSB	LSS bottle filling system
LSS	life support system
LVS	low volume sampler
mA	milliamperes
MCC	motor control center
	mine component container
MCP	Monitoring Concept Plan
MDB	munitions demilitarization building
MDM	multipurpose demilitarization machine
MEL	master equipment list
MER	mechanical equipment room
mg/m ³	milligrams per cubic meter
MIG	mine glovebox
MIN	mine machine
MMS	mine and munitions system
MPB	munitions processing bay
MPF	metal parts furnace

MPL	multiposition loader
	maximum permissible limit (for DPE)
MPRS	miscellaneous parts removal station (PMD)
MSB	monitor support building
MSS	munition sampling system
NaOCl	sodium hypochlorite
NaOH	sodium hydroxide
NCRS	nose closure removal station (PMD)
NEMA	National Electrical Manufacturers Association
NEPA	National Environmental Policy Act
NFPA	National Fire Protection Association
NG	natural gas
NRT	near real time
O&M	operations and maintenance
OBV	observation corridor
ONC	onsite container
OS	orientation station (MIN)
OSHA	Occupational Safety and Health Administration
OVT	operational verification testing
P&A	precision and accuracy
P&ID	piping and instrument diagram
PA	public address
PAS	pollution abatement system
PBA	Pine Bluff Arsenal
PBCDF	Pine Bluff Chemical Agent Disposal Facility
PCS	primary cooling system
PCT	preconcentrator tube
PDAR(S)	process data acquisition and recording system
PDE	projectile deformation equipment
PDIT	pressure differential indicator transmitter
PDS	pull and drain station (MDM)
	punch and drain station (MIN)
PFD	process flow diagram
PFS	PAS filter system
pH	potential of hydrogen (a measure of acidity or alkalinity)
PHS	projectile handling system
PID	proportional integral derivative
pig	overpacked shipping container
PKPL	pick-and-place machine (also PPL)
PLA	plant air system
PLC	programmable logic controller
PLL	programmatic lessons learned (program)
PLS	proximity limit sensor/switch
PMB	personnel and maintenance building
PMCD	Program Manager for Chemical Demilitarization
PMCDSD	Project Manager for Chemical Stockpile Disposal
PMD	projectile/mortar disassembly (machine)
PML	personnel, maintenance, and laundry (complex or building)
POT	potable water
PPL	pick-and-place machine (also PKPL)
PPS	primary power system

PQAP	Participant Quality Assurance Plan
PRW	process water
PSB	process support building
psig	pounds per square inch, gauge
PSV	pressure safety valve
PUB	process and utility building
PUDA	Pueblo Depot Activity (Colorado)
PWR	power systems (unit substation, uninterruptible power supply, battery rooms, and emergency generator)
RCRA	Resource Conservation and Recovery Act
RDS	rocket drain station
RDTE	research, development, testing, and evaluation
RFI	Request for Information
RHA	residue handling area
RHS	rocket handling system
rpm	revolutions per minute
rps	revolutions per second
RSM	rocket shear machine
RSS	rocket shear station
RTAP	real-time analytical platform
SC	systems contractor
SCBA	self-contained breathing apparatus
scf	standard cubic foot
scfh	standard cubic feet per hour
scfm	standard cubic feet per minute
SCW	secondary cooling water
SCT	systems contractor for training
SDS	spent decon system
sg	specific gravity
SGS	steam generation system
SOP	standing operating procedure
SPS	secondary power system
SRS	slag removal system
TBD	to be determined
TCE	treaty compliance equipment
TEAD	Tooele Army Depot (Utah)
TIP	tray information packet
TM	Army Technical Manual
TMA	toxic maintenance area
TNT	trinitrotoluene (explosive)
TOCDF	Tooele Chemical Agent Disposal Facility
TOX	toxic cubicle
TSCA	Toxic Substances Control Act
TSHS	toxic storage and handling system
TSO	Tight shutoff
TWA	time-weighted average
UE&C	United Engineers and Constructors
UMCDF	Umatilla Chemical Agent Disposal Facility
UPA	unpack area
UPS	uninterruptible power supply
UV	ultraviolet

VCR	video cassette recorder
VX	nerve agent, O-ethyl S-(2-diisopropylaminoethyl) methylphosphonothiolate (C ₁₁ H ₂₆ NO ₂ PS)
wc	water column
WTS	water treatment system
XXX	3X level of decontamination
XXXXX	5X level of decontamination (minimum of 1000°F for 15 minutes)
Z	general designation for monitoring hazard level

APPENDIX B

FAWB Notes

Appendix B contains notes to expand upon the descriptions contained in the text of the FAWB. The notes include related experiences at TOCDF and the Johnston Atoll Chemical Agent Disposal System (JACADS).

- B-1 Per discussions held during the comment resolution matrix meeting for the HVAC FAWB on 9-10-98, the programmatic process FAWBs are being prepared under the assumption that the DUN, DUN PAS and DUN PFS (at ANCDF) systems will not be used for processing at ANCDF, PBCDF, TOCDF, or UMCDF. A programmatic process FAWB for the DUN/DUN PAS/PFS is not being developed. Handling and disposal of dunnage is considered a site-specific activity that has not yet been determined. The DUN, however, is installed at TOCDF and remains in the designs at ANCDF and PBCDF. At UMCDF, the DUN was being removed from the design, however, its use at UMCDF is currently being studied.
- B-2 Per discussions held during the comment resolution matrix meeting for the PAS FAWB on 11-10-98, the programmatic process FAWBs for the PAS and PFS have been combined into a single PAS/PFS FAWB that applies to ANCDF, PBCDF, TOCDF, and UMCDF.
- B-3 The acid/caustic storage and wash system is no longer used at TOCDF and has been removed from the ANCDF, UMCDF, and PBCDF site designs by ECPs ANAC343PAS, R1, UMAC160PAS, R1, and PBAC340PAS, respectively.
- B-4 Rocket cut lengths at TOCDF are specified in TOCDF ECP TEMP-2006-RSM. Rockets are sheared into eight sections (seven cuts). The design basis for ANCDF, UMCDF, and PBCDF calls for the rockets to be sheared into seven sections (six cuts). The TOCDF ECP was reviewed by the FDLL and will be implemented at future sites by cloning of the software (i.e., the operational configuration at TOCDF will be implemented at the follow-on sites). Encoder values set to specify the cut length will vary from machine to machine and from site to site due to subtle differences between the machines. The encoder values in the baseline code delivered to the follow-on sites will match the TOCDF encoder values and may require adjustment to achieve the desired cut lengths.

UMCDF is developing a revised cut sequence for rockets with tetrytol busters. The revised sequence includes an additional cut in the burster section for a total of eight cuts. The other burster-section cuts are smaller than for normal rockets. When processing these rockets, the DFS feed sequence will also be revised (see FAWB Note B-5).

- B-5 The rocket pieces feed sequence was optimized during OVT 4 at JACADS. The highest throughput rates were achieved using a three-dump sequence in which the fuze of one rocket is dumped with the fin/tail assembly of the previous rocket. The second dump feeds the agent cavity, which is cut into four pieces, and the third dump feeds the two motor sections. The motor section is cut into three pieces; the third is the fin/tail assembly that is fed to the DFS with the fuze of the next rocket. The design documentation for the follow-on sites does not match the TOCDF configuration (i.e., DFS mass and energy balance calculations assume only seven rocket pieces with a different dump sequence); however, it is planned to have the operational configuration at TOCDF implemented at the follow-on sites.

In conjunction with a revised cut sequence for rockets with tetrytol busters (see FAWB Note B-4), UMCDF is developing a revised feed sequence for them as well. The feed sequence will include six or seven dumps (rather than three) in order to spread out the explosive feed to the DFS.

- B-6 Water was used for shear blade spray during OVT2, the VX rocket campaign, and found to be acceptable. Water was initially used during OVT 1, the GB rocket campaign, and agent levels in the ECR were high. After switching to decon spray on the shear blade, agent levels were reduced by approximately 50%. The TOCDF SOP specifies that decon is used during GB rocket processing and water is to be used during VX rocket processing. The design documentation for the follow-on sites does not match the TOCDF configuration (i.e., DFS mass and energy balance calculations assume that decon is used for VX rockets); however, it is planned to have the operational configuration at TOCDF implemented at the follow-on sites.
- B-7 Duplex agent strainers were incorporated into the RHS AQSs at ANCDF, PBCDF, and UMCDF by ECPs ANAP0444AQS R1, PBAP0388AQS R1, and UMAP0218AQS R1, respectively. At TOCDF, since piping and instrumentation were already installed, it was determined to be too costly to replace the single filter with a duplex strainer.
- B-8 The configurations for the AQS verification tank level transmitter (51-LIT-51 [51-LIT-57]) sensing lines at TOCDF and follow-on sites are different in the referenced documentation. TOCDF has two three-way solenoid valves (i.e., AQS tank level sensor isolation valves 51-XV-55A & 55B) that isolate the transmitter during purging of the sensing lines to prevent the purge air from disrupting the calibration of the transmitter. The valves vent to atmosphere when in the closed position to prevent pressurizing the level sensing lines associated with 51-LIT-51. In January 1999, the PM-CSD Acquisition Team requested that ANCDF, PBCDF, and UMCDF field offices direct the systems contractor to prepare field ECPs to incorporate the TOCDF air bubbler system, including the TOCDF AQS verification tank level transmitter sensing line configuration, into the RSM AQS.

Therefore, ANCDF, PBCDF, and UMCDF will have an RSM AQS similar to the TOCDF RSM AQS.

- B-9 At TOCDF, the original purge time for the AQS tank LIT sensing line was two seconds. After encountering problems with the LIT reading high levels, a software change was made to increase the duration of the purge to fifteen seconds because it was suspected that the LIT was not being properly purged after the completion of the drain cycle. No further problems with the LIT reading high levels have been seen at TOCDF since this change has been incorporated.
- B-10 At TOCDF, Operation 7 in SOP TE-SOP-093, Unpack Area Operations, covers processing of ONCs containing leakers in the UPA if the ONC ACAMS reading is < 40 TWA or the ONC has a bad seal with an ACAMS reading ≥ 40 TWA. ONCs with a good seal and an ACAMS reading ≥ 40 TWA are sent to the TMA for processing.
- B-11 Under ECP TEMP-1344-TMA, TOCDF fabricated two lightweight, leaker rocket carrier containers to transport leaking rocket pallets from the TMA to the ECV. Each carrier can transport a single pallet. The ECP was reviewed by the FDLL and similar containers will be used at the follow-on sites.
- B-12 TOCDF originally had a single fiber optic sensor (42-1PLS-5 [42-2PLS-5]) that indicated when a rocket had passed the pusher engagement point and was ready to be sheared. Under ECP-1702-RSM, TOCDF implemented a change to add a fiber optic sensor next to 42-1PLS-5 that must be made while 42-1-PLS-5 is clear before the shear blade can extend to shear a rocket. The change was made to prevent a rocket having a broken indexing ring from being sheared in the wrong place. The new sensor was tagged as 42-1-PLS-5B and 42-1PLS-5 was retagged to be 42-1PLS-5A. The ECP was reviewed by the FDLL passed forward to future sites via the Equipment Fabrication Contractor. The design drawings do not show the revised configuration.
- B-13 *Under ECP TEMP2529CON R1, TOCDF converted three single operator consoles that were used for DPE entry monitoring to dual workstation consoles. One of the three consoles was converted to an additional demil workstation. The E-stops on this console are hardwired with other E-stops so they do not have unique, discreet inputs to the PLC. The additional E-stops are not shown on TOCDF P&IDs. At other sites, an additional demil console (ICS-CONR-109) was added by ECPs ANAC262SRL, PBAC303SRL, and UMAC118SRL. The ICS-CONS-109 E-stops were added to the PBCDF and UMCDF design drawings by PBAC1014ICS and UMAP928ICS, respectively. At ANCDF, ANAP1120ICS was approved to add the E-stops to the drawings, but the drawings have not yet been revised.*
- B-14 In the October 1997 TOCDF code, the ECR-Explosion-Detected interlocks for many of the Line A & B RSM devices did not match. The EIC has indicated that

for follow-on sites, the Line A and B interlocks will be the same; the ECR-Explosion-Detected interlock will be included for all devices as shown in the RDS and RSS A&I matrices for Line B. TOCDF has been notified of the discrepancies.

B-15 Under ECP TEMP2450RSM, TOCDF modified the rocket processing code to allow bypassing of the RDS for rockets whose GB-agent fill was suspected to be gelled/crystallized. The code modification included adding a selection to the rocket line initialize screen, RLI, for gelled rockets. When selected, the entire sequence at the RDS was bypassed, and the rocket was conveyed directly to the RSS, where it was processed normally. All agent was fed directly to the DFS with the rocket. TOCDF processed 5,287 rockets, from rocket lot #s 1033-55-1076, 1033-55-1077 and 1033-61-1086, as gelled rockets. During gelled-rocket processing, TOCDF was limited by their permit with the State of Utah to feed only 1 rocket per hour to the DFS.

ANCDF, PBCDF, and UMCDF have reviewed the TOCDF ECP for potential implementation at their sites. ANCDF has identified a significant portion, up to 33%, of their M55 rocket stockpile, that may contain gelled agent. Therefore, they plan to implement similar changes as they prepare to process the suspect rockets lots. PBCDF believes that none of their rocket lots contain gelled agent, however, there are a few lots that have a slight possibility of having it. The current plan at PBCDF is to attempt to drain all rockets normally. If any gelled-agent rockets are encountered, they will consider implementing the TOCDF software modification at that time. UMCDF has identified only a small number of rockets that they suspect of containing gelled agent, however, they are also implementing a gelled-rocket processing sequence. The follow-on sites are considering adding a vent punch at the RDS for gelled rockets instead of completely bypassing it, as TOCDF did.

B-16 TOCDF found that, during rocket processing, fiberglass, crystals, etc. can bypass the AQS strainer by being drawn through the strainer vacuum line, which resulted in plugging of the agent lines to the ACS tanks. To prevent this occurrence, TOCDF issued ECP TEMP2469RSM to modify the PLC code and remove the strainer vacuum valve from the control sequence. After CDTF testing of this configuration with the universal AQS, it was determined that vacuum lines on the rocket AQS strainers provide no significant advantage to the draining of rockets. As a result, ANCDF removed the strainer vacuum lines and valves via ECP ANWP1574ACS. Removal of these lines also facilitates maintenance and personnel access in the ECR. The PLC sequence has been revised at PBCDF and UMCDF to remove operation of the strainer vacuum valve from the control sequence. They are still reviewing the ANCDF ECP for removal of the hardware.

B-17 TOCDF found that some of their overpacked rockets had end caps epoxied to the shipping and firing tube to prevent agent from leaking from the tube into the overpack container. The end caps added length to the rocket, which created a

mismatch between the rocket length and the encoder settings at the shear station. If processed normally, the cuts at the shear station would be made in the wrong positions. TOCDF modified the rocket processing code to adjust the encoder setpoints when processing rockets with end caps. Unique RSS encoder setpoints were calculated for each rocket based on the difference between the initial pusher position for the rocket with an end cap and a normal rocket. Because of the additional length of the rockets with end caps, the ROCKET FAIL TO STAGE at the shear station alarm was disabled to allow for automatic processing. The modification also included adding a selection to the rocket line initialize screen, RLI, for rockets with end caps. ANCDF, PBCDF, and UMCDF are all incorporating this change into their rocket processing software.

- B-18 TOCDF completed all rocket processing on November 17, 2003. TOCDF rocket campaigns included processing of M55 rockets and M56 rocket warheads. The M56 warheads originated from M55 rockets that had the rocket motors removed. The warheads consisted of a fuse, a burster, and an agent-filled, aluminum warhead packed in a propellant charge can. The GB campaign began on 22 Aug 1996 and was completed 14 Aug 2001. All of the GB M56 warheads and the majority of the GB M55 rockets were processed on Line B, controlled by PLC ICS-CONR-104A. Line A, controlled by PLC ICS-CONR-101A, was used only from 22 Aug 1996 through 3 April 1999. All VX-filled M55 rockets were processed on Line B. Therefore, ICS-CONR-101A PLC code does not necessarily reflect the final rocket-processing configuration at TOCDF. Descriptions in the FAWB reflect the TOCDF Line B configuration.*
- B-19 Under ECP TEMP2556RSM R1, TOCDF created the new operator control screen, ECR, which displays both ECRs, ECR doors, dampers, differential pressure, agent concentration, and E-stop status. Certain devices can be controlled from the screen as well. The ECR screen was added to provide the operators with a consolidated view of certain key parameters in the ECRs for use during operations, maintenance or upset conditions. Previously, CON operators had to access different screens in order to monitor system status and operate the equipment. ANCDF has added the screen. PBCDF and UMCDF are reviewing the change and are expected to implement a similar change.*

APPENDIX C

Alarm and Interlock Matrices

Appendix C contains *alert tables*, alarm and system response tables, and alarm/alert and interlock (A&I) matrices for the RHS. *Alert tables are site-specific, applying to ANCDF and TOCDF only. When PBCDF and UMCDF alarm/alert studies are completed and implemented¹, the results will be included in this appendix. All of the A&I matrices are programmatic, applying to all four sites, except for AQS matrices. Site-specific matrices were prepared to clarify the current AQS configuration at each of the sites.*

The *alert tables and* alarm and system response tables list the instrument tag number, a description of the instrument, and the system response to the alarm/alert. *Alert tables were created for ANCDF and TOCDF to implement recommendations from studies that reclassified many of the alarms to be alerts. The alert classification was created to distinguish between conditions that require immediate operation response (alarms) and those that don't (alerts). Alerts are indicated differently on the CON Advisor screens and are not accompanied by audible annunciation in the CON. For ANCDF and TOCDF, one table lists the alerts for both lines, and another table lists the alarms.*

A&I matrices depict in a consolidated format the software and hardware alarms and interlocks for the equipment and instrumentation in a specific system. For the RHS, programmatic A&I matrices are presented in 6 different matrices, each associated with a portion of the rocket line. The 6 matrices are:

- (1) Rocket Input Feed Assembly - Line A
- (2) Rocket Input Feed Assembly - Line B
- (3) Rocket Drain Station - Line A
- (4) Rocket Drain Station - Line B
- (5) Rocket Shear Station - Line A
- (6) Rocket Shear Station - Line B

Site-specific A&I matrices were generated for the AQS components because there are too many differences between some of the sites to present the interlocks clearly. Therefore, there are three AQS matrices, one for ANCDF, one for TOCDF, and one for PBCDF and UMCDF, which are similar.

¹ *PBCDF and UMCDF alarm/alert studies have been completed but not yet implemented. PBCDF prepared ECP PBSF1808STE to implement it, but the ECP was returned pending resolution of a few minor issues. UMCDF is preparing an ECP to implement the alarm/alert study results. When the ECPs are approved, the alarm and alert tables for PBCDF and UMCDF will be included in this appendix.*

Specific guidelines were developed during development of utility system FAWBs for ANCDF and UMCDF that are followed in the programmatic FAWBs. *Fourteen* specific guidelines have been established that define the format and content of entries in the A&I matrices:

1. Analog signals from transmitters (e.g., LITs) are not listed; the alarms are indicated separately.
2. All software prealarms and alarms (e.g., LAHs) that are indicated in the CON are listed. Setpoints and actions are shown where applicable.
3. Equipment and instrument status indication signals (e.g., open/close, on/off) are not listed unless they initiate action.
4. Alarms generated from GFE package units that report to the PLC are listed. If not already available and listed, the GFE internal alarms and actions will be added to the matrix when available from the site systems contractor and “*SC to provide detail*” will be entered into the “remarks” column.
5. For field switch generated alarms, the switch tag is listed, not the alarm tag. For example, a low-low pressure alarm (PALL) generated by the field switch, 13-PSLL-008, is listed as 13-PSLL-008 rather than 13-PALL-008. The purpose for this listing is to distinguish between field switch generated hardwired alarms and alarms generated in the software based on the analog output from a transmitter.
6. Instruments that initiate actions are listed in a vertical column sorted by prefix, loop number, instrument ID, then suffix. For example, for 99-TSH-100A, the prefix is 99, the loop number is 100, the instrument ID is TSH, and the suffix is A). Actions are listed in column across the top of the matrix and include prealarms and alarms.
7. Setpoints are listed for all instruments where applicable. Instrument ranges for analog transmitters are shown in Appendix F. Unless otherwise noted, tank level setpoints are shown from the level transmitter tap.
8. Only hand switches (push buttons) that cause system shutdowns are listed; other software and hardwired hand switches are not listed.
9. Local alarms are not listed.
10. Matrices are grouped by subsystem as applicable within each FAWB. For example, separate matrices are provided in the RHS FAWB for the rocket input feed assembly, the rocket drain station of the RSM, and the rocket shear station of the RSM.
11. Alarms associated with automatic actions are classified as “*alarms*” and alarms without automatic actions are classified as “*prealarms*.”
12. Instruments listed in the matrix that are RCRA reportable are designated as such by entering “*RCRA*” in the Remarks column.

13. Clarifications are provided when necessary in the remarks column of the A&I matrices, or in the system and/or operator response column in alarm and system response tables.
14. *Device malfunction alarms are not shown unless they initiate automatic actions such as equipment switchovers (e.g., to a standby pump), system shutdowns, or a stop feed signal.*

NOTE:

1. PBCDF and UMCDF alarm/alert studies have been completed but not yet implemented. PBCDF prepared ECP PBSF1808STE to implement it, but the ECP was returned pending resolution of a few minor issues. UMCDF is preparing an ECP to implement the alarm/alert study results. When the ECPs are approved, PBCDF and UMCDF alarm tables will be modified and alert tables will be included in this appendix.

NOTE:

1. PBCDF and UMCDF alarm/alert studies have been completed but not yet implemented. PBCDF prepared ECP PBSF1808STE to implement it, but the ECP was returned pending resolution of a few minor issues. UMCDF is preparing an ECP to implement the alarm/alert study results. When the ECPs are approved, PBCDF and UMCDF alarm tables will be modified and alert tables will be included in this appendix.

ROCKET SHEAR STATION - LINE B

LOCATION: MDB 2ND FLOOR ECR B
AREAS: 03
PLC: ICS-CONR-104A
P&IDs: AN/PB/TE/UM-1-D-502, -553, -554
INTERLOCK: I-2

NOTES:

- 1) LOGIC IN THIS MATRIX IS ALSO WRITTEN IN TEXT FORM IN APPENDIX D.
- 2) DEVICES ARE SHOWN ACROSS THE TOP, INTERLOCKING CONDITIONS ARE SHOWN DOWN THE SIDE.
- 3) SQUARES MARKED BY "X" INDICATE DEVICE IS INTERLOCKED DUE TO THE LISTED CONDITION
- 4) SQUARES MARKED BY "Y" INDICATE DEVICE INTERLOCK DOES NOT APPLY TO ALL SITES. DETAILS ARE IN THE REMARKS COLUMN.
- 5) SQUARES MARKED WITH A NUMBER INDICATE THE BRANCH LEVEL WITHIN THE INTERLOCK RUNG. LIKE NUMBERS ARE COMBINED TO MAKE A BRANCH.

43		ROCKET AGENT HEEL NOT > 0							X	X		

APPENDIX D

PLC Automatic Control Sequences

Appendix D contains a summary of PLC automatic control sequences based on the current versions of the PLC code for each of the sites. This appendix also includes the sequencer tables for the sequencers that control operation of the RDS and the RSS of the RSMs.

The PLC automatic control sequence summaries were generated based on the control system rung ladders in the PLC code for the rocket handling system. The operator interface with the PLCs, the Advisor PC system, stores device information in a database that consists of *tags*, or database records used for storing all necessary information related to a device that is monitored or controlled by the Advisor PC system. **D6** tags are used for discrete devices that may be controlled from the Control Room. In this appendix, automatic control for all devices with **D6** tags are described, grouped by the Advisor PC screens on which they appear.

D.1 RHS PLC Automatic Control Sequences

The 5 screens described in this appendix for the RHS are listed in Table D.1. The screen designations for similar screens for rocket line B are shown in [].

Table D.1 RHS Advisor PC Screens

Advisor PC Screen Name	Process Screen Designation
Rocket Feed Line A [B]	RFA [RFB]
Rocket Demil Line A [B]	RDA [RDB]
Rocket Initialize Screen	RLI

For Advisor screens RFA, RFB, and RLI, RHS PLC automatic control sequences are similar at all four sites. Therefore, the control sequences are listed in a single table for these screens with annotations in the description to indicate the differences, if any, between the control for the device at the different sites. In addition, if control differences exist between the 2 similar rocket-processing lines at any of the sites, these differences are also noted.

Because TOCDF has completed processing rockets, and the other sites are just beginning to process them, with modifications to the AQS and other demil logic and interlocks, there are some significant differences between the RHS PLC automatic control sequences for similar devices at TOCDF and the other sites. Therefore, for clarity, the TOCDF logic for demil devices is listed in one table, and the device logic for all other sites is listed in a separate table. In addition, because rocket line A at TOCDF was last used for rocket processing in

April 1999, and will not be used in the future, PLC logic for RDA is outdated and is not listed. TOCDF rocket demil logic is listed for RDB only (see FAWB Note B-18).

At *all sites*, control for rocket line A is provided by ICS-CONR-101A and control for rocket line B is provided by ICS-CONR-104A. Control sequences for analogous devices for each of the two rocket lines are listed in Tables D.2 through *D.5*, with the device identifiers (e.g., tag numbers, component numbers) for line B enclosed in brackets []. The information in the tables is based on the *ANCDF and UMCDF control system rung ladders as of July 2003, and PBCDF and TOCDF control system rung ladders as of September 2003. Devices are listed sequentially by the driver word.*

Device:	(AN ONLY) RHS-RSM-101 [RHS-RSM-102] Air Blast to Proximity Switches (42-XV-011 [42-XV-021])
Advisor PC Tag:	X42XV011 [X42XV021]
CONR:	C101A [C104A]
Driver Word:	0686 [0686]
Driver Type:	None - Not a standard driver The operator selects this icon and issues a manual “OPEN” command to provide air to the RSM proximity switches. There is no “AUTO/MANUAL” status nor interlocks. When the RSM is running in auto, the valve opens. When the RSM station is no longer running in auto, the valve closes. However, the operator can subsequently manually open the valve and it will remain open until it is manually closed.
Device:	(AN ONLY) DFS-GATE-101 [DFS-GATE-102] Washdown Water
Advisor PC Tag:	X03XV177 [X03XV277]
CONR:	C101A [C104A]
Driver Word:	0687 [0687]
Driver Type:	4
Auto Start:	The auto start relay will be active if either of the following conditions is satisfied: <ul style="list-style-type: none"> • “Upper Gate Sprays” cycle timer value \geq 175 seconds (see below). • 03-XS-161 [03-XS-261] RHS-HOPP-101 [RHS-HOPP-102] discharge chute fire is not active (Line A is DICO from ICS-CONR-112). <p>NOTE: The DFS gate washdown water start driver energizes three discrete outputs: 1) 03-XV-174 [03-XV-274], 2) 03-HY-176 [03-HY-276], and 3) 03-XV-177 [03-XV-277], which open the 3 valves in the process water line that supplies gate spray water.</p>
Start I-Lock:	None
Timer:	“Upper Gate Sprays” cycle timer (see above) begins timing when the following conditions are satisfied: <ul style="list-style-type: none"> • “Upper Gate Sprays” cycle timer is not done • “Rocket Piece on DFS Gate” relay (see below) is active
Relay:	“Rocket Piece on DFS Gate” relay (see above) is latched when the following conditions are satisfied: <ul style="list-style-type: none"> • Either of the following conditions are satisfied: <ul style="list-style-type: none"> • 42-1PLS-4-I [42-2PLS-4-I] (RSM Pusher Home) is not made, 42-1PLS-6-I [42-2PLS-6-I] (RSM Rocket at Index Stop) is made, and 42-1205A [42-2205A] RSM shear cylinder extended is made • Any of the following: <ul style="list-style-type: none"> • “Fuze or Tail Pieces on DFS Feed Gate” relay is active (DICO to ICS-CONR-112)

D.2 RHS Sequencer Tables

Sequencers are used throughout chemical demilitarization facilities to perform sequenced machine control. A sequence is a series of steps that a machine performs to accomplish a task. One or more actions are required to perform each step. The step is complete when the desired results are met. Sequencers are used to control the RDS and RSS operations in the RHS. *The RSS sequencers at all sites are similar, so only a single sequencer table, ANCDF RSS Line A, is included for the RSS station. Because the RDS sequencers are different between TOCDF and the follow-on sites, two sets of RDS sequencer tables are included, ANCDF RDS Line A and TOCDF RDS Line B. The TOCDF Line B RDS tables are shown because it is the line on which TOCDF processed the majority of their rockets (See FAWB Note B-18).*

When a sequencer advances to a step, up to 32 bits of output control information are generated to produce a desired set of actions. The sequencer monitors up to 32 bits of status input data and remains at that step until all the desired results are met. Once a step is complete, the sequencer advances to the next step. This continues until the task that the sequencer controls is complete. When the task is complete, the sequencer resets itself back to the beginning (usually step 1.1).

The design of the CSDP PLC-3 sequencer uses five sets of data and two counters. The data sets are defined as follows:

1. Actual Input - Up to 32 discrete status indications can be defined for each sequencer. They can be inputs from the field (proximity switch, pressure switch, etc.) or internally generated relays (level indication > 17.0 inwc.). Once defined, these 32 bits have the same meaning for each step in the sequencer. For example, if bit 1 is defined as "Stop Clamp Retracted", then that is the definition of bit 1 for all of the sequencer steps. On every scan of the PLC-3 application code, these 32 data points are packed into one contiguous area of memory to be compared to the Input Comparison data for the sequencer step.
2. Input Comparison - The Input Comparison data are stored in the PLC-3 memory, one 32-bit set for each step. For a sequencer step to be complete, the Actual Input data and the Input Comparison data must be equal when filtered through the Normal Mask data set for the step.
3. Normal Mask - The Normal Mask data are stored in the PLC-3 memory, one 32-bit set for each set. The Normal Mask is used during normal, vice bypass mode, operation. Not all Actual Input data are meaningful at every step of the sequence. The Normal Mask allows the sequencer to ignore the status of a particular input while testing for completion of a step. For example, at RDS sequencer step 2.2 "Extend Bottom Clamp", we "don't care" if the RSM is in a shear cycle. Therefore, bit 15 of word 2 of the normal mask for step 2.2 is a zero or "don't care." Now when the Actual

Input is moved through the Normal Mask, the result will be a zero for bit 15 so that when the result and the Input Comparison data are compared, step 2.2 can be completed whether bit 15 of word 2 is set or not.

4. Bypass Mask - The Bypass Mask works just like the Normal Mask except it is only used when the operator bypasses a sequencer step. For example, step 5.3 of the RDS sequencer is where the rocket is drained. To complete step 5.3 under normal conditions the AVS system must indicate that a good drain has occurred. If, after repeated drain attempts, the AVS system fails to) provide a good drain indication, the operator can bypass the step and force the sequencer to step 5.4. Not all steps can be bypassed. For bypass to be enabled, bit 14 of Output word 2 must be set for the step that is to be bypassed.
5. Output - The Output data are stored in the PLC-3 memory, one 32-bit set for each step. When a sequencer advances to a step, up to 32 bits of output control information are generated to produce a desired set of actions. This data is generally used in the logic that energizes the automatic action relays for the sequenced machine components. Bits 14-17 of Output word 2 have special functions as follows:
 - 14 - Bit 14 is set if the step can be bypassed.
 - 15 - Bit 15 is set if the step can be repeated.
 - 16 - Bit 16 is set if the step is the last Minor Step in the current Major Step.
 - 17 - Bit 17 is set if the step is the last step in the sequencer.

The sequencer step status is maintained by two counters. One counter is for the Major Step, the other is for the Minor Step. For example, step 7.2 is Major Step 7 and Minor Step 2. A Major Step reflects a complete task. A Minor Step is one of the tasks required to complete a Major Step. For example, RDS Major Step 7 will rotate the rocket. The Minor Steps to rotate the rocket are: 1) raise the lift table, 2) actuate the rotator, 3) lower the lift table, and 4) home the rotator. When a step is complete (i.e., Actual Inputs match the Input Comparisons) the Minor Step counter increments. If the step was the last Minor Step in the Major Step (Output word 2, bit 16 set), the Minor Step counter is reset to zero and the Major Step counter is incremented. If the step was the last Minor Step in the sequencer (Output word 2, bit 17), the Major Step counter is set to the initial step for the campaign (usually 1) and the Minor Step counter is set to 1.

Repeat. Some steps, such as RDS step 5.3 “rocket drain verification”, can be repeated. For these steps, Output word 2, bit 15 is set as a permissive. When the operator requests that a step be repeated, the Major Step is decremented and the Minor Step is reset to zero. In the case of the rocket drain, the sequencer would reset to step 4.0 to punch and drain the rocket a second time. The sequencer goes to manual when the repeat command is issued and must be returned to automatic to resume normal operation.

Manual Stepping. The operator can manually step through the sequencer. To do this the sequencer must be in manual. Once the machine status and the desired status are equal for a step, the operator can request a manual step. The sequencer will increment to the next step and issue new Output data and access new Input Comparison data.

Reset. The operator can reset the sequencer at any time. When the sequencer resets, the Major Step counter for the sequencer is set to the initial step for the campaign (usually 1). The Minor Step counter is reset to zero, the sequencer goes from automatic to manual, and the Input Comparison data for the initial step for the campaign becomes the desired status for completion of the step. Because the machine can be in any combination of states, the operator must take manual action to match the Actual Input data to the Input Comparison data using the View Sequencer display on the Advisor. Once the machine status and the desired status are equal, the operator can place the sequencer back into automatic and processing will resume starting with Minor Step 1 of the initial Major Step.

View Sequencer. The operator can determine the status of a sequencer step by accessing the View Sequencer information on the Advisor control screen for the sequencer. The View Sequencer feature displays the Actual Input data from the machine and the Input Comparison data for the sequencer step. Any mismatches are highlighted to provide the operator with immediate feedback as to what actions must be taken to complete the sequencer step.

Initialize. During initialization, the Major Step counter for the sequencer is set to the initial step for the campaign (usually 1). The Minor Step counter is reset to zero.

Park. During System Park, the sequencer is set to step 0.1. When the Actual Input data and the Input Comparison data are equal, the sequencer is reset to step 0.0.

APPENDIX E

Operator Screens

Appendix E contains the Advisor PC screens associated with operation and control of the RHS based on *ANCDF and UMCDF control code from July 2003, and PBCDF and TOCDF control code from September 2003*. Table E.1 provides an index to the screens.

Table E.1 RHS Advisor PC Screens

APPENDIX F

Instrument Ranges

Table F.1 shows the *RHS system* instrument data extracted from the TOCDF Loveland calibration database as of *August 2000*. *Instrument calibration databases for other sites were not available when this draft was prepared*. Not all instrument tag numbers listed are part of the design at ANCDF, PBCDF, and UMCDF. *When instrument calibration databases for other sites are available, the instrument ranges will be added to this appendix*.

Table F.1 RHS Instrumentation in TOCDF Loveland Instrument Calibration Database

INSTRUMENT TAG	RCRA	INPUT			OUTPUT			SET POINT	LOOP DEFINITION
		LOW	HI	UNIT	LOW	HI	UNIT		
03-XSH-127A	No	0	1	psig	0	0		0.5	ECR A Explosion
03-XSH-127B	No	0	1	psig	0	0		0.5	ECR A Explosion
03-XSH-227A	No	0	1	psig	0	0		0.5	ECR B Explosion
03-XSH-227B	No	0	1	psig	0	0		0.5	ECR B Explosion
51-LIT-051	Yes	0	30	in. wc.	4	20	mA		ACS-TANK-103 Level
51-PIT-051	No	0	15	psi	4	20	mA		ACS-TANK-103 Pressure
51-LIT-057	Yes	0	30	in. wc.	4	20	mA		ACS-TANK-104 Level
51-PIT-057	No	0	15	psi	4	20	mA		ACS-TANK-104 Pressure

APPENDIX G

Intercontroller Communications

RHS operations are controlled by the same two PLCs at all four sites. ICS-CONR-101A controls operations associated with rocket line A and ICS-CONR-104A controls operations associated with rocket line B.

Table G.1 lists the digital intercontroller inputs and outputs (DICIs/DICOs) for ICS-CONR-101A, and Table G.2 lists the DICIs/DICOs for ICS-CONR-104A. The DICOs listed are based on the *ANCDF and UMCDF control code as of July 2003, and PBCDF and TOCDF code as of September 2003*.

Table G.1 RHS Line A DICIs/DICOs (ICS-CONR-101A)
